Summary

Results-driven and adaptable Computer Science graduate with hands-on experience in full-stack web development and systems integration. Contributed to the design and development of a web-based timekeeping system, emphasizing backend development using JavaScript and Node.js while ensuring seamless integration of hardware devices. Skilled in analyzing system performance, implementing effective debugging strategies, and leveraging AI tools to optimize development workflows. A collaborative team player with strong communication and problem-solving skills, experienced in agile methodologies and cross-functional collaboration to deliver functional, user-centered solutions.

Education

Philippine Christian University – Dasmariñas

BS in Computer Science — Graduated June 2026

Key Skills

Microsoft Office
Google Workspace
Figma, VS Code
Github
Canva
Wix

JavaScript, HTML, CSS
Manual Software Testing
Node.js
Documentation Writing
SQL/XAMPP
Web Development

Work/Internship Experience

**Web Developer Intern, Pasay Taft Tourist Dev Inc.
(Urban Travellers Hotel)**

February 2026 - May 2026

- Collaborated in system design and conceptualization, offering insights and suggestions that contributed to a fully deployed attendance and timekeeping system.
- Built backend functionality using JavaScript and Node.js, integrating ZKTeco libraries to establish reliable communication with a biometric device serving ~70 active employees.
- Coordinated technical integration of the system and timekeeping device, ensuring seamless and stable functionality upon deployment.
- Analyzed system performance metrics and resolved all identified bugs through targeted debugging strategies, improving overall system reliability.
- Optimized development workflows by integrating AI assistance—such as ChatGPT and Claude—for coding and debugging tasks, accelerating development throughput.

Academic Project

VISILIYS

Web-Based Visitor & License Plate Management Logging System with Facial Recognition, OCR & GPS (Group Project — Role: System Designer & Documentation Lead)

Tracks visitor entries, exits, and destinations to strengthen village security; classifies visitors as vehicle-based or pedestrian and registers first-timers prior to entry.

- Created system UI mockups using Figma, translating complex system requirements into clear, navigable interface designs that guided the team's development direction.
- Designed the system concept and overall architecture for a multi-feature platform integrating facial recognition, OCR, and GPS, successfully delivered and defended as a capstone project.
- Managed and maintained structured project documentation across a 4-member team, ensuring consistent alignment throughout the development lifecycle.
