*Based on real testing work performed during my internship on the employee attendance and timekeeping system.
Documents a workflow gap I identified during QA and resolved as a developer.*

Title	Manual schedule re-entry during shift swaps — automated and improved
Module	HR — Schedule Swap
Type	Workflow gap (not a defect — found during manual QA pass)
Found by	QA testing
Resolved by	Self (developer)

Observation

While testing the shift swap modal, I noticed that Employee 1's original schedule for the selected swap date was not being automatically carried over to Employee 2 (and vice versa). HR staff had to manually re-enter schedule details for both employees after every swap — a slow process and prone to data-entry mistakes, particularly when special schedule conditions (overtime, flex schedules, broken schedules) were involved.

Risk if Left Unaddressed

Manual re-entry increases the chance of mismatched schedules between swapped employees, particularly around overtime and non-standard shift types — the exact details that are easiest to miss when entering by hand.

Fix Implemented

- Modal now automatically fetches each employee's existing schedule for the selected swap date.
- Added a checkbox option: when enabled, if either employee's schedule includes OT or a flex/broken schedule, that detail is automatically carried over to the other employee as part of the swap — in both directions.
- Removes the manual re-entry step entirely for the common case.

Outcome

Reduced manual data entry during schedule swaps and reduced the risk of mismatch errors caused by staff forgetting to replicate OT/flex schedule details when swapping manually.
